

VS TASK LIST VIEW

After installing the package form the package manager, you might notice the new Menu item “Void Tool”

You can use the Menu item: Void Tool > Visual Studio > Open TaskList

Or use the shortcut ctrl+t and the following window appear.

There are 4 types of comments this tool will display:

- `//!` for an important comment line
- `/?` for a question comment line
- `//TODO` for a normal comment line
- `//X` for a faded-out comment line

You can click on the individual comment line to open visual studio on the comment line itself or click Open File to open the file itself.

The list refreshes every time unity refreshes the Assets folder, but you can also manually refresh it.

You can choose to get a debug log every time the list refreshes but have the choice to turn it off

the list is sorted by script and then by priority level (priority level is the same as how it is shown above)
